AB - DE19542287 A

In preparation of di- and higher-oxidised carboxylic acids or carbohydrates, carbohydrate derivatives or prim. alcohols, a 0.1-60% aqueous solution of the carbohydrate (or derivative), prim. alcohol or mono-oxidised derivative of these is oxidised with oxygen or a gas

ontinue: Y / N

containing oxygen, on a noble metal or mixed metal catalyst, the stream of products is fed to one or more electrodialysis stages in series, and the di- or higher-oxidised carboxylic acids are removed and recovered there.

- ADVANTAGE - The di- or higher-functionalised saccharides or saccharide derivatives are hydrophilic, compatible with the skin and form complexes, allowing of easy derivatisation to products in the polymer and tenside sectors. They have better ecological properties than petrochemical products. The catalyst was not deactivated in a 3-day test. Selectivity is better. (Dwg.1/2)
